

Mac OS X 10.7 /10.8 Server - the M&M Web Interface does not work

Symptom:

I have successfully installed the Web Interface on the **server version** of Mac OS X 10.7 or 10.8 but when I enter the URL

```
https://my Lion or Mountain Lion IP or DNS name/MenAndMice
```

it shows an error that it can't be found.

Problem:

The server version uses a different directory for the config files. Instead of

```
/etc/apache2/other
```

it stores the "other" config in:

```
/Library/Server/Web/Config/apache2/other
```

Solution

Login with a Terminal and copy the file mmwebext.conf from

```
/etc/apache2/other
```

to

```
/Library/Server/Web/Config/apache2/other
```

and restart Apache. Or just execute the following commands:

```
sudo cp /etc/apache2/other/mmwebext.conf /Library/Server/Web/Config/apache2/other/  
apachectl restart
```
